

Most CTOs are operating against flat or declining budgets whilst business demands increase with each new trend and market opportunity. This gets tougher each year as Cloud, Big Data, Mobile and IoT create an ever-widening gap between what the business expects and what IT can deliver.

# INTEGRATION MANAGED SERVICE

*Estafet core delivery models*

**COLLABORATIVE, INNOVATIVE TEAMS MEANT WE DELIVERED FOR 90% LESS**

Estafet are specialists in enterprise integration and operate three models depending on your flexibility, maturity and need. We specialise in Java-based middleware using our distributed agile teams across the UK and Bulgaria. We recently delivered a core business system to an infrastructure company for 90% less than their offshore supplier and to far higher quality.

## WHY USE A MANAGED SERVICE?

Customers often need to extend their delivery capability without increasing headcount. This could be because there is a short-term requirement to augment staff, a specific programme of work to complete, or simply that their corporate strategy is not built around being a software house.

Our managed service approach brings experienced and skilled integration experts into your organisation. We run different models according to customer need, each supported by a dedicated Service Delivery Manager who is responsible for the customer relationship, the welfare and productivity of the teams.

*Service Delivery Manager balances resource needs*

*Wide experience across industry*

Cloud architectures are driving more robust integration design using open source and open standards

EFFECTIVE, PRODUCTIVE, VALUED

**Trusted Teams**

**Clear Reports**

## DISTRIBUTED MONITORING

As microservices demand greater fragmentation of logic and data, tracing transactions and choreography across multiple servers becomes ever more complex.

We have teamed up with Red Hat and leading universities to deliver effective distributed monitoring using OpenTracing and Jaeger. This gives you faster diagnosis; application of policy against observations and goals; and protection against miscreant microservices.

In the short term, this helps solve your GDPR and other distributed monitoring needs. The strategic aim is to understand the "Voice of the Machine" and compare this with what the business thinks it is (or should be) doing, the "Voice of the Business".

We are both thought leaders and pragmatic implementers in this new area of distributed computing. Call us to find out how we can help.
